Site-1 protease cleaves sterol regulatory element binding proteins (SREBPS) in the endoplasmic reticulum, initiating release from membranes and activating lipid synthesis. The modulators therefore also modulate cholesterol and fatty acid biosynthesis. The method comprises selecting an agent capable of down regulating site-1 protease and formulating a composition comprising the agent. The site-1 protease inhibitors are useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human site-1 protease (SIP) promoter region. The promoter sequence is useful for identification of compounds that inhibit transcription of SIP, which in turn results in inhibition of sterol regulatory element-binding protein (SREBP) pathway. The compound identified is useful for the treatment of medical conditions related to obesity, type II diabetes, hypercholesterolaemia, dyslipidaemia, atherosolerosis and other cardiovascular diseases. The present sequence is hamster site-1 protease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MKLVNIWILILIVVLLCGKKHLGDRLEKKSFEKAPCPGCSHLTLKVEFSSTVVEYEYIVAF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is rat subtilisin-kexin isoenzyme 1 (SKI-1),

a type-1 membrane-bound proteinase. The nucleotide sequence was isolated

from rat adrenal glands by RT-PCR using active site degenerate

primers. SKI-1 cleaves at a specific threonine residue within

primers. SKI-1 cleaves at a specific threonine residue within

the N-terminal segment of pro-brain derived neurotrophic factor

(probDNT). It is also capable of cleaving sterol-regulatory

clement-binding proteins (SREDPs), which function to control lipid

biosynthesis and uptake in animal cells. Peptides which bind to and are

cleaved by SKI-1 may be used for monitoring SKI-1 activity, for screening

inhibitors of SKI-1 activity, or for screening enhancers of SKI-1

catalytic site may be used as inhibitors of SKI-1 activity. They may

catalytic site may be used as inhibitors of SKI-1 or SKI-1

catalytic substrate. Such diseases include hypercholesterolaemia, high levels of

fatty acids, lipids or farnesyl pyrophosphate, liver steatosis,

catalytic and cancer, restenosis and amyloid protein formation.

                                                                             The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) Immune disorders e.g. Addison's disease, allergies, autoimmune hamolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and parasitic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GGIMPGRYNQEVGQTIPVFAFLGAMVVLAFFVVQINKAKSRPKRRKPRVKRPQLMQQVHP 1046

Novel invertebrate organism genetically modified to express or mis-express steroid regulatory element binding protein pathway protein used as model system for studying lipid metabolism and determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of Drosophila melanogaster dSIP, a homologue of mammalian site 1 proteases (SIP) that are involved in sterol regulatory element binding protein (SREBP) processing, cleaving SREBP at the lumenal loop. SREBPs are transcription factors that activate genes involved in cholesterol and fatty acid synthesis, and are major mediators of insulin action in the liver. Alterations in SREBP function and expression are implicated in obesity and insulin resistance. The dS2P DNA was identified from an expressed sequence tag database search on the basis of homology (Caenorhabditis elegans) polynucleotides (see AAA89287-90) and

encoded proteins (see AAB20012-15) involved in the SREBP pathway.
C. elegans and D. melanogaster animals genetically modified to express or mis-express these proteins are claimed. These genetically modified animal models have identifiable phenotypes that make them useful in assays for studying lipid metabolism, other genes implicated in lipid metabolism and compounds capable of modulating lipid biosynthetic pathways. Model organisms or cultured cells can be used to identify new drug targets, therapeutic agents, diagnostics and prognostics of disorders associated with lipid metabolism, and also to identify pesticide targets directed to components of the SREBP pathway.
                                                                                                                                                                                                                   Ouery Match 42.1%; Score 2366.5; DB 22; Length 992; Best Local Similarity 46.6%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WIPO

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating and activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or
Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 MKLVNIWLLLLVVLLCGKKHLGDRLEKKSFEKAPCPGCSHLTLKVEFSSTVVEYEYIVAF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         In the example, the inventors inactivate the apr gene by insertion of a functional cat gene coding for chloramphenicol acetyltransferase from S, aureus. The inserted cat gene confers chloramphenicol resistance, thus facilitating the selection of transformants. The reduced levels of subtilisin greatly reduces the likelihood that a secreted forlegn protein will be proteolytically degraded prior to recovery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                   Bacillus strains with reduced extra-cellular protease levels -
useful as hosts for secretion of heterologous polypeptide(s) and
proteins.

denomic DNA was isolated from cells of B. subtilis strain OB127 (trpC2 leuAB sacUh200). The coding region of the aprA gene was sequenced and the results of the sequence are given in ANBO745. The specific condentity of the initial 5 codons of the leader region is attributable to the report of Stahl, et al., J. Bacteriol., 158, 411-418, (1984) and formed at all P.N.A.S. Bl, 1184-1188 (1984). There exist codon sequence of inferences from Stahl, et al., reports a codon GTV (coding for value) appears in ANBO745. Stahl, et al., reports a codon GTV (coding for value) appears in ANBO745. Stahl, et al., also reports a codon ACC (coding for serine) at amino acid position 85 as opposed to the codon GCG (coding for serine) an anioque which has an amino acid sequence of a naturally occuring consistive subtilisin which has been modified by having: one or more of Bacillus subtilisin which has been modified by having: one or more of any Asn-G1y sequence of the naturally occuring Bacillus subtilisin ceplaced by a negatively charged amino acid, and continued and modeleted of replaced by a different amino acid, and continued and acid. Pref. it is subtilisin deleted or replaced by a different amino acid, was subtilisin analogue of subtilisin Carlsberg, subtilisin BPN', an analogue of subtilisin and broad subatrate specificity thereby increased specific activity and broad subatrate specificity thereby analogues. Example 2; Table 1, Pages 22-24; 60pp; English.

                                                                                                                      Modified analogues of subtilisin are useful in cleaning fabrics, a have an improved resistance to oxidisation, heat and pH extremes. Analogues have one or more negative AAs present in the calcium binding site (CBS) and may also be used in manufacture of protein hydrolysates, and detection of incomplete Abs in serology.
Bacillus subtilin analogues – with improved pH thermal and oxidn. stability useful in cleaning compsns.
                                                                                                                                                                                                                                                                                                                                                                                   97;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents pro-subtilisin of Bacillus
subtilis, and was used to demonstrate the method of the invention.
The propeptide is essential for the production of active, correctly
folded subtilisin. The Mi8T substitution resluted in a suppression
of this activity. An in vitro method to restore or increase the
natural biological activity of a target polypeptide (inactive or with
decreased activity due to improper folding), which is normally expressed
containing a prosequence forms the basis of the invention. An exogenous
activating apptide used to promote refolding of the target polypeptide
of the target or other proteins with a similar sequence and function to
the target polypeptide. The method is used to produce biologically,
correctly folded proteins from their inactive, incorrectly folded forms.
Suitable target polypeptides include members of the serine protease or
subtilisin families.

The present sequence represents pro-subtilisin of Bacillus subtilisin of strain 168, and was used to demonstrate the method of the invention. To investigate the role of the propeptide of subtilisin, an expression system for the active subtilisin E was established in Escherichia coli system for the pro-sequence of pre-pro-subtilisin with the E. coli capped and peptide. When the amino terminal 14 residues of the propeptide are deleted, no active subtilisin forms, and the shortened propeptide are deleted, no active subtilisin. An in vitro method correction of active, correctly folded subtilisin. An in vitro method correcte or increase the natural biological activity of a target polypeptide (inactive or with decreased activity due to improper folding), which is normally expressed containing a prosequence forms the assis of the invention. An exogenous activating peptide ecomprises the prosequence of the target polypeptide to give its active form. The crefolding of the target polypeptide to give its active form. The proteins with a similar sequence and function to the target polypeptide. The method is used to produce and function to the target polypeptide. The method is used to produce and function to the target polypeptide. The method is used to produce and function to the target polypeptide. The method is used to produce and function to the target polypeptide. The method is used to produce and function to the target polypeptide. The method is used to produce of the serine protease or subtilisin formalises.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           17;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                95
                                                                                                                                           B.subtlis II68 chromosomal DNA was digested with ECORI. A single 6kb fragment hybridised to a fragment from the C-terminus of the subtlisin structural gene in pS4 (see AAN71240). It was ligated to ECORI-cut pBS42 and the ligation mixture used to transform E.coli ATCC 31446. Plasmid DNA was prepared from a pooled suspension of transformant colonies and used to transform a protease deficient strain of B.subtliis. BG84. Plasmid DNA from protease producing colonies was digested with ECORI and examined by Southern blot analysis to isolate the 6kb fragment. A positive clone was identified containing a plasmid designated pS168.1. Three HincII fragments and a HincIII-ECORI fragment ware ligated into M13 vectors and sequenced to obtain the entire subtliisin sequence from which the amino acid sequence of subtliisin was deduced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              QVSYTSWFLDAFNYAILKKIDVLNLSIGGPDFMD--HPFVDKVWELTANNVIMVSAIGND

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence is that of a bacterial serine protease in which the methionine adjacent to the serine of the active site is replaced by another amino acid. The protease is used in a detergent composition which comprises conventional detergent ingredients plus an enzyme system comprising a lipase and the protease variant. The protease variant does not attack the lipase and thus prevents lipase degradation. Liquid detergent compens, are obtd. which are stable during storage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Liquid detergent compsn. contg. lipase and protease - i.e.
barderial serine protease in which methionine near active site is
replaced

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      greater than 10 in the presence of linear alkylbenzene sulphonate greater than 10 in the presence of linear alkylbenzene sulphonate were isolated by collecting soil from an alkaline environment which had been exposed to detergent condmanination or which had a pH greater than 12. Strains were isolated which had alkaline protease activity which was stable in the presence of detergent. The protein cancer was compared to that of Bacillus species alkaline elastases, from B. carlsberg, B. subtilis and B. amyloliquefaciens BPN to determine if the novel protease was from a bacillus species. The novel protease showed between 60-75 percent homology to the elastase from the other strains, thus indicating that the protease is from a novel bacillus strain designated Bacillus 164A. The alkaline protease is used in heavy duty detergents as the enzymes are useful to decompose proteinaceous stains and perform at high pH which are beneficial to the detergency of the surfactants in the liquids. The enzyme is stable for enzyme is also useful in cheese mfr. and as a dehalring enzyme for enzyme is also useful in cheese mfr. and as a dehalring enzyme for

                                                                                                                                                                                                                                                                                                                                                                                                                       The amino acid sequence of the Bacillus subtilis subtilisin protein. The gene is used in a method to produce a carbonyl hydrolase (subtilisin) e.g. the B.amyloliquefaciens subtilisin (AAQ90041) or other heterologous protein (produced as a tusion protein) e.g. human growth hormone, such that the desired protein is translated as a preproprotein which can be transported across the cell membrane but is not released as an enzymatically functional protein until the application of an external protease encoded by the host cell e.g. B.subtilis but is no neutral protease (AAQ90043). The preproprotein sequence is mutated so that it is incapable of autoproteolytic maturation. The B.amyloliquefaciens sequence was mutated using the primers AAQ90044-5 and Q*******, specifically at $221N, b32N, A46R or contained a deletion of 166 amino acids from the C-terminus of the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EKQKAGLLTLE-DHPNIKRVTPQRKVFRSLKYAESDPTVPCNETRWSQKWQSSRPLRRAS 166

This sequence is the subtilisin protein of Bacillus subtilis. Subtilisin is an alkaline protease which Bacillus secrete. The protein sequence is used in the formation of a fusion protein which has an N-terminal cused in the formation of a fusion protein which has an N-terminal sequence linked to a C-terminal non-subtilisin polypeptide. The C-terminal sequence can alternatively be a subtilisin which has an among a manure protein in one or more of the catalytic triad of this sequence. The mutations take the form of a substitution at position 221 in the wild type mature protein may also be substitution at position 32 in the wild type mature protein may also be used, with the wild type Asp replaced by Asn. A substitution may also be substitution at position 64. These mutat subtilisins can be used as the second part of the fusion protein. The mutated versions of subtilisin are incapable of autoproteolytic maturation. The DNA fusion sequences are useful for the production of heterologous proteins. As the subtilisin mutants are incapable of autoproteolytic maturation, they are the cable mentant protein to leave the cell membrane means that they are not able to degrade desired proteins when heterologous protein production is being carried out in Bacillus cells. Heterologous proteins are sequestered at carried out in Bacillus cells. Heterologous proteins are sequestered at cerymatically active subtilisin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      48 SSTVVEYEYIVAFNGYFTAKARNSFISSALKSSEVDNWRIIPRNNPSSDYPSDFEVIQIK 107

                                                                                                           - COFACTOR: Calcium-dependent.
- COFACTOR: Calcium-dependent.
- ENYTME REGULATION: Inhibited by divalent copper and zinc ions, but not by nickel or cobalt. Inhibited by its prosegment, but not smaller fragments thereof.
- SUGCELLOLAR LOCATION: Type I membrane protein; endoplasmic reficulum and Golgi. May sort to other organelles, including lysosomal and/or endosomal compartments.
- TISSUE SPECIFICITY: Widely expressed.
- INDUCTION: Down-regulated by sterois.
- INDUCTION: Down-regulated by sterois.
- PTM: The 148 kba zymogen is processed progressively into two membrane-bound 120 and 106 kba forms in the endoplasmic reticulum, and late into a secreted 98 kba form: The propeptide is autocataly removed through an intramolecular cleavage after leavage generates 14, 10, and 8kba intermediates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 MKLVNIWILLILVVILCGKKHLGDRLEKKSFEKAPCPGCSHLTLKVEFSSTVVEYEYIVAF 60

I SIGNAL
of the sterol regulatory element-binding proteins (SREBPs). Other known substrates are BDNF and AFFFG.
CATALITIC ACTIVITY: Cleaves after hydrophobic or small residues, provided that Arg or Lys is in position P4. Cleaves known substrates after Arg-Ser-Val-Leu (SERBP-2), Arg-His-Leu-Leu (AFFE), Arg-Gly-Leu-Thr (BDNF) and its own propeptide after Arg-Leu-Leu.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AGG/LUS/PRO-RICH (BASIC).

COFACTOR: Calcium-dependent (By similarity).

ENZYME REGULATION: Inhibited by divalent copper and zinc ions, but not by nickel or cobalt. Inhibited by its prosegment, but not by nickel or cobalt. Inhibited by its prosegment, but not smaller fragments thereof (By similarity).

SUBCELLUIAR LOCATION: Type I membrane protein; endoplasmic reticulum and Golgi. May sort to other organelles, including lysosomal and/or endosomal compartments (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PTM: The 148 kDa zymogen is processed progressively into two membrane-bound 120 and 106 kDa forms in the endoplasmic reticulum, and late into a secreted 98 kDa form. The propeptide is autocatalytically removed through an intramolecular cleavage after
                                                                                                                                                                                                                                                                                                         Sakai J., Rawson R.B., Espenshade P.J., Cheng D., Seegmiller A.C., Goldstein J.L., Brown M.S.; and interesting in the sterol-regulated luminal protease that cleaves SREBPs and controls lipid composition of animal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                               YE J., RAWSON R.B., KOMUTOR., Chen X., Dave U.P., Prywes R.,

Fress induces cleavage of membrane-bound ATFG by the same.
proteases that process stress.

MOIT CELL 6:1355-1354(ZUUU)

TROUTION: "CALATYSES THE TIRST Step in the proteolytic activation of the sterol regulatory element-binding proteins (SREBPS).

Other known substrates are BDNF and ATFG.

-- CATALYIC ACTIVITY: Cleaves after hydrophobic or small residues, provided that Arg or Lys is in position P4. Cleaves known substrates after Arg-Ser-Val-Leu (SERBP-2), Arg-His-Leu-Leu

(ATFG), Arg-Gly-Leu-Thr (BDNF) and its own propeptide after Arg-

PURCEASE SECTION OF 1321-1326 (1999)

1. FUNCTION: Catalyzes the first step in the proteolytic activation of the sterol regulatory element-binding proteins (SREBPS).

2. Other known substrates are BDNF and AFF6.

2. Other known substrates are the proper of small residues, provided that Ago or Lys is in position P4. Cleaves known substrates after Arg-Ser-Val-Leu (SREBP-2). Arg-His-Leu-Leu substrates after Arg-Ser-Val-Leu (SREBP-2). Arg-His-Leu-Leu (AFF6).

3. Other Calcium-dependent (By similarity).

4. COPRACTOR: Calcium-dependent (By similarity).

5. COPRACTOR: Calcium-dependent (By similarity).

6. SMEDELLOIREN LOCATION: Thiblited by its prosegment, but not smaller fragments thereof (By similarity).

7. SMEDELLOIREN LOCATION: Type I membrane protein; endoplasmic reticulum and Golgi May sort to other organelles, including lysosomal and/or endosomal compartments (By similarity).

7. TSSUE SERCIFICITY: Widely expressed. In adult rat, highly expressed in anterior pituitary, thyroid and adreanal glands and in liver. In 2-day old rat, detected in developing skin, striated
